Some slides displaying the results of modelling runs cannot yet be distributed and so are not included here.

# The ERAMMP Integrated Modelling Platform (IMP) Overview for SFS Stakeholders Meeting 28<sup>th</sup> July 2021

**Professor Paula Harrison**  
*UK Centre for Ecology & Hydrology*

# The complexity of environmental challenges

**MULTIPLE DRIVERS**

**COMPLEX INTERACTIONS**

Between Drivers

Between Sectors

Across Space

**COMPLEX CHALLENGES  
... AND OPPORTUNITIES**

How to incentivise change?

How to maximise synergies ...

... and avoid unexpected trade offs!

**AGRICULTURE**

**BIODIVERSITY**

**FORESTS**

**RURAL LIVLIHOODS**

**PUBLIC GOODS**

**ENVIRONMENT**

# Scenario and modelling platforms

**Scenarios:** Combine consistent changes in multiple drivers to portray a range of plausible futures for a region.

**Models:** Simulate consequences of scenarios and enable exploration of the effectiveness of policy options and management strategies.

## Integrated Modelling Approaches:

- Single sector models may misrepresent the **direction, magnitude and spatial pattern** of impacts because they omit the complex interdependencies within human-environmental systems.
- Integrated models **build understanding of these interdependencies** and allow exploration of responses that are robust to multiple uncertain futures and avoid unintended trade-offs.

# Benefits of integrated cross-sectoral modelling

Differences between single sector and integrated models by regions within the EU:

|                          | European Union | Alpine (EU) | Atlantic (EU) | Continental (EU) | Northern (EU) | Southern (EU) |
|--------------------------|----------------|-------------|---------------|------------------|---------------|---------------|
| Biodiversity (arable)    |                | ↕           |               | ↕                | ↕             |               |
| Unmanaged land           |                |             |               |                  |               |               |
| Biodiversity (forest)    |                |             |               |                  |               | ↕             |
| Arable land              | ↕              |             | ↕             | ↕                |               | ↕             |
| Intensive agriculture    | ↕              |             | ↕             | ↕                |               | ↕             |
| Extensive grassland      | ↕              |             | ↕             | ↕                |               | ↕             |
| Irrigation               |                |             |               |                  |               |               |
| Carbon storage           |                |             |               | ↕                |               | ↕             |
| Water exploitation index |                | ↕           |               | ↕                |               |               |
| Food provision           |                |             |               |                  |               |               |
| Flooded people           |                | ↕           |               | ↕                |               | ↕             |
| Unmanaged forest         |                |             |               |                  |               |               |
| Managed forest           |                |             |               |                  |               |               |
| Urban area               |                |             |               |                  |               |               |

|               |  |
|---------------|--|
| Change > 100% |  |
| Change > 50%  |  |
| Change > 25%  |  |
| Change > 5%   |  |
| Change < 5%   |  |

↕ Direction of change differs between single sector and integrated models

Harrison et al. (2016). Climate change impact modelling needs to include cross-sectoral interactions. *Nature Climate Change*, 6(9): 885-890.

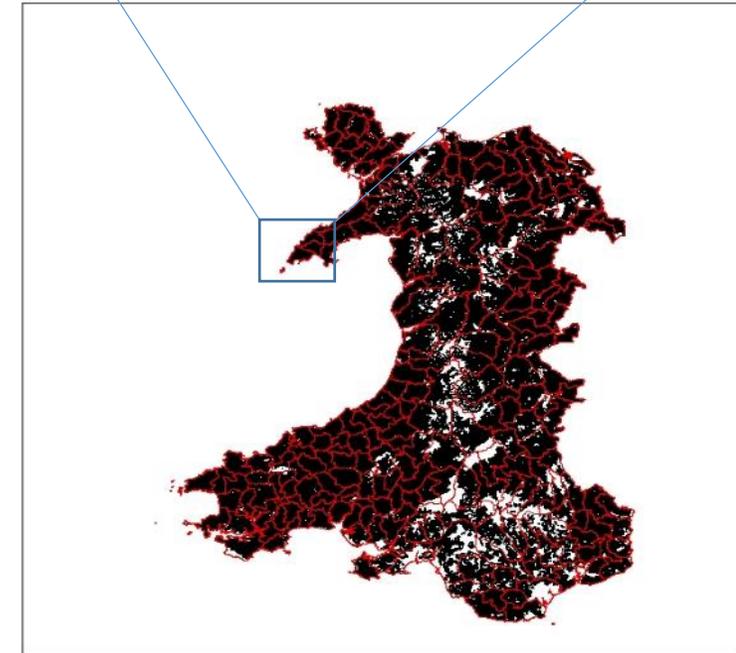

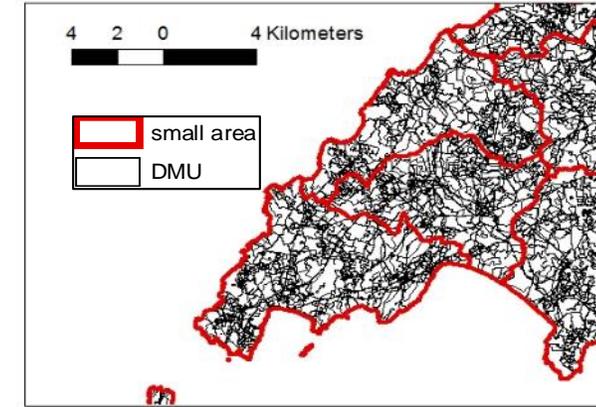

# What is the ERAMMP IMP?

- A tool for rapid exploration of the effects of policy and management interventions on farm viability, land use and public goods in Wales.
- It takes an integrated approach, recognising that policy effects in one sector have indirect effects in other sectors.
- It comprises a chain of specialised, state-of-the-art models covering agriculture, forestry, land use allocation decisions, water, air, soils, biodiversity, ecosystem services and valuation.
- User specified interventions and model outputs are aligned where possible to support and inform policy development:
  - Post EU Exit trade deals
  - Implications of the Sustainable Farming Scheme (Ongoing)

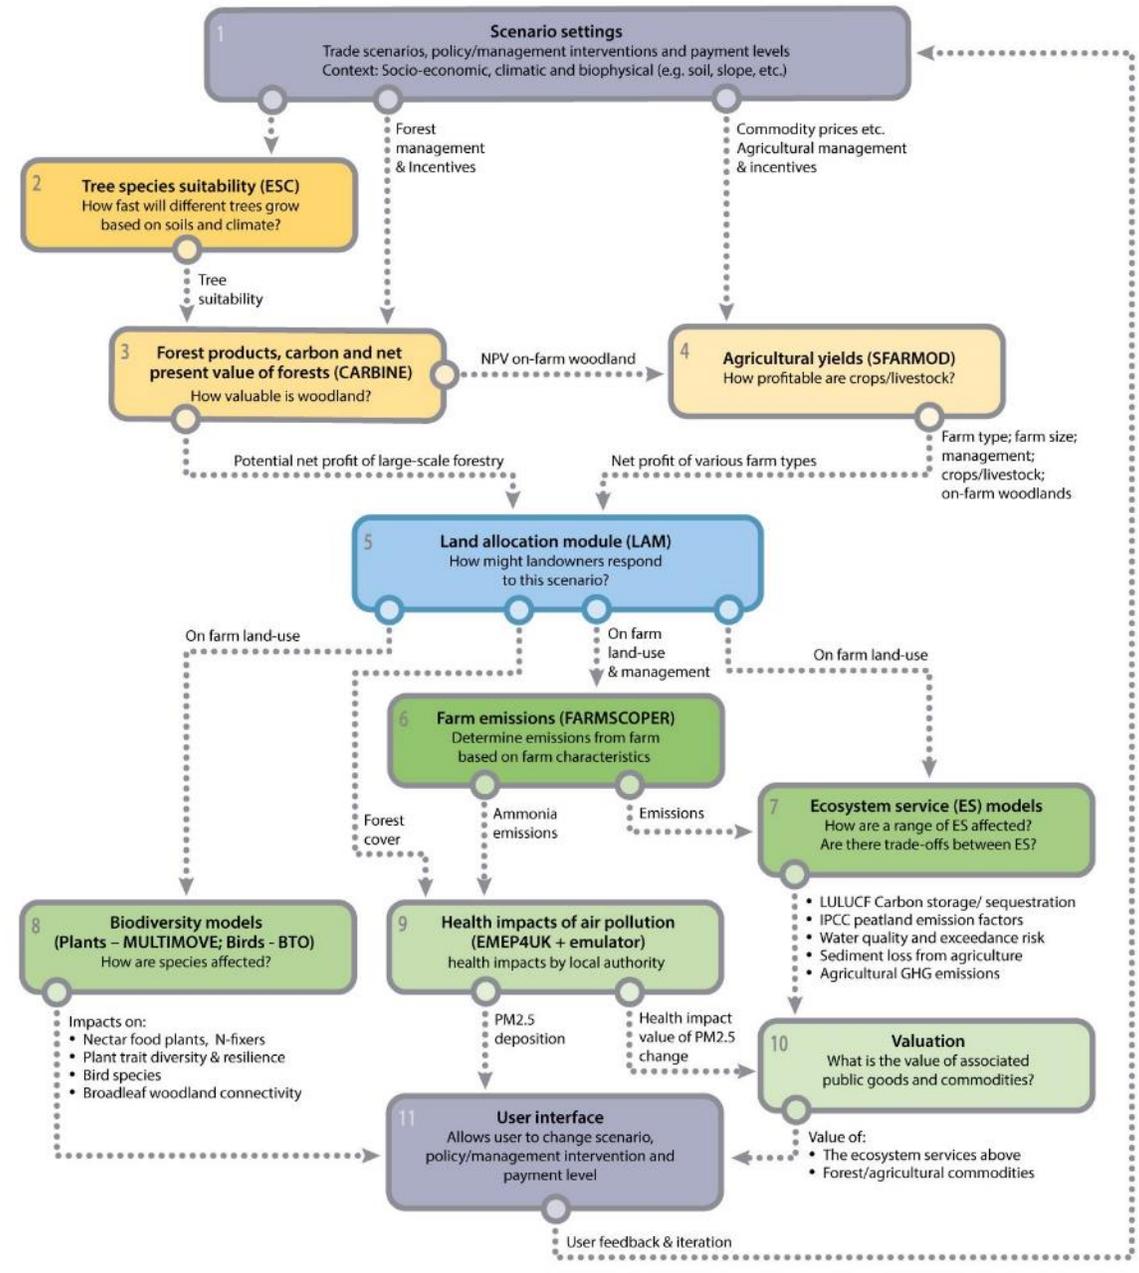

# What is the ERAMMP IMP?

- It is highly spatially resolved:
  - The IMP operates at various spatial resolutions depending on what scale is most appropriate for the indicator being simulated.
  - The finest spatial resolution is used for simulating farm type and land use transitions is the Decision-Making Unit (DMU).
  - A DMU is sub-farm (often field-scale) defined as a managerially homogenous cluster of soil type, rainfall and land cover.

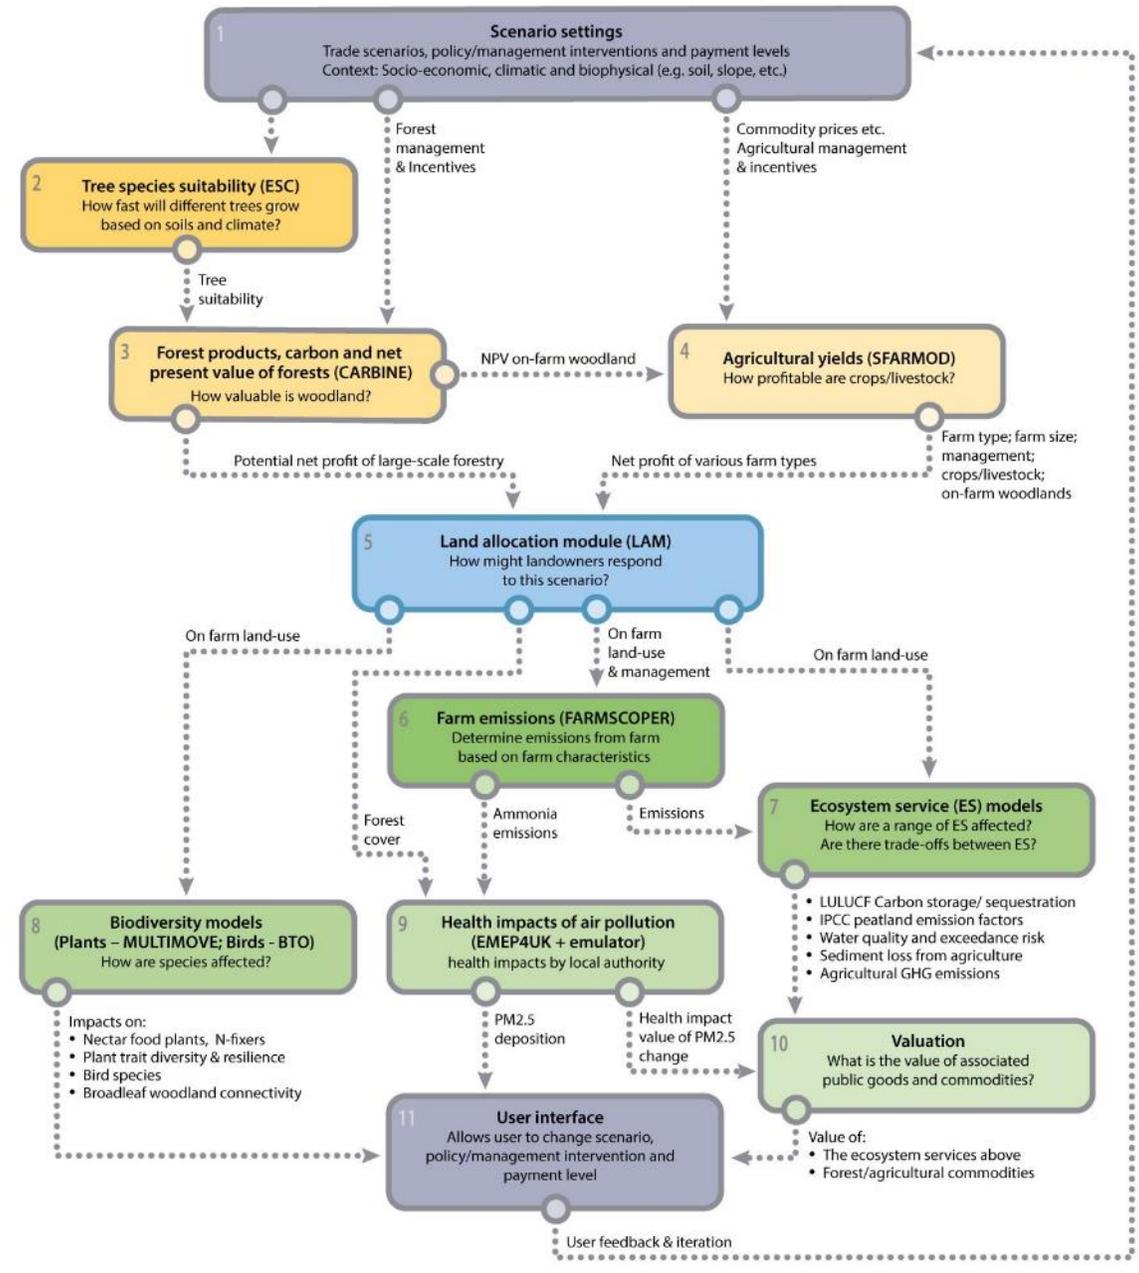

# IMP schematic

- Scenario settings co-created with Welsh Government
- Over 10 linked models
- Each model is run for multiple scenario settings to build up a data cube
- Data is passed between models to represent interdependencies between sectors
- Interface to present/access data

# IMP schematic

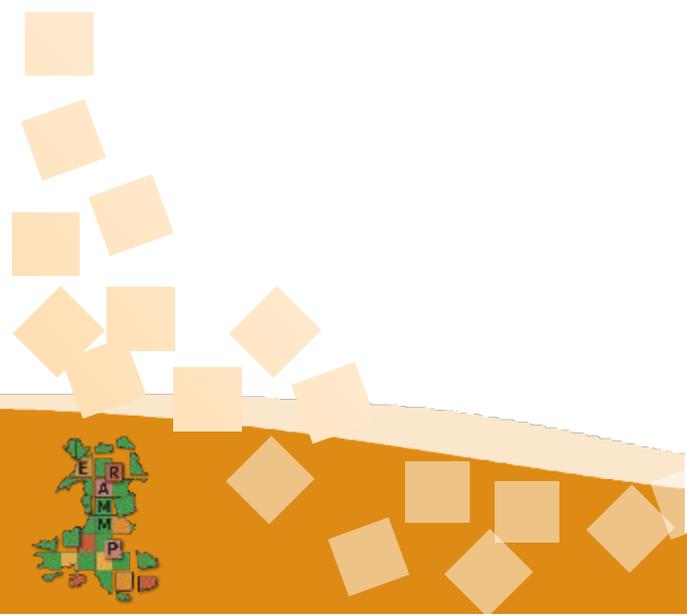

Scenario settings co-created with Welsh Government

## Top of modelling chain:

- Simulates land use and land management change

## Bottom of modelling chain:

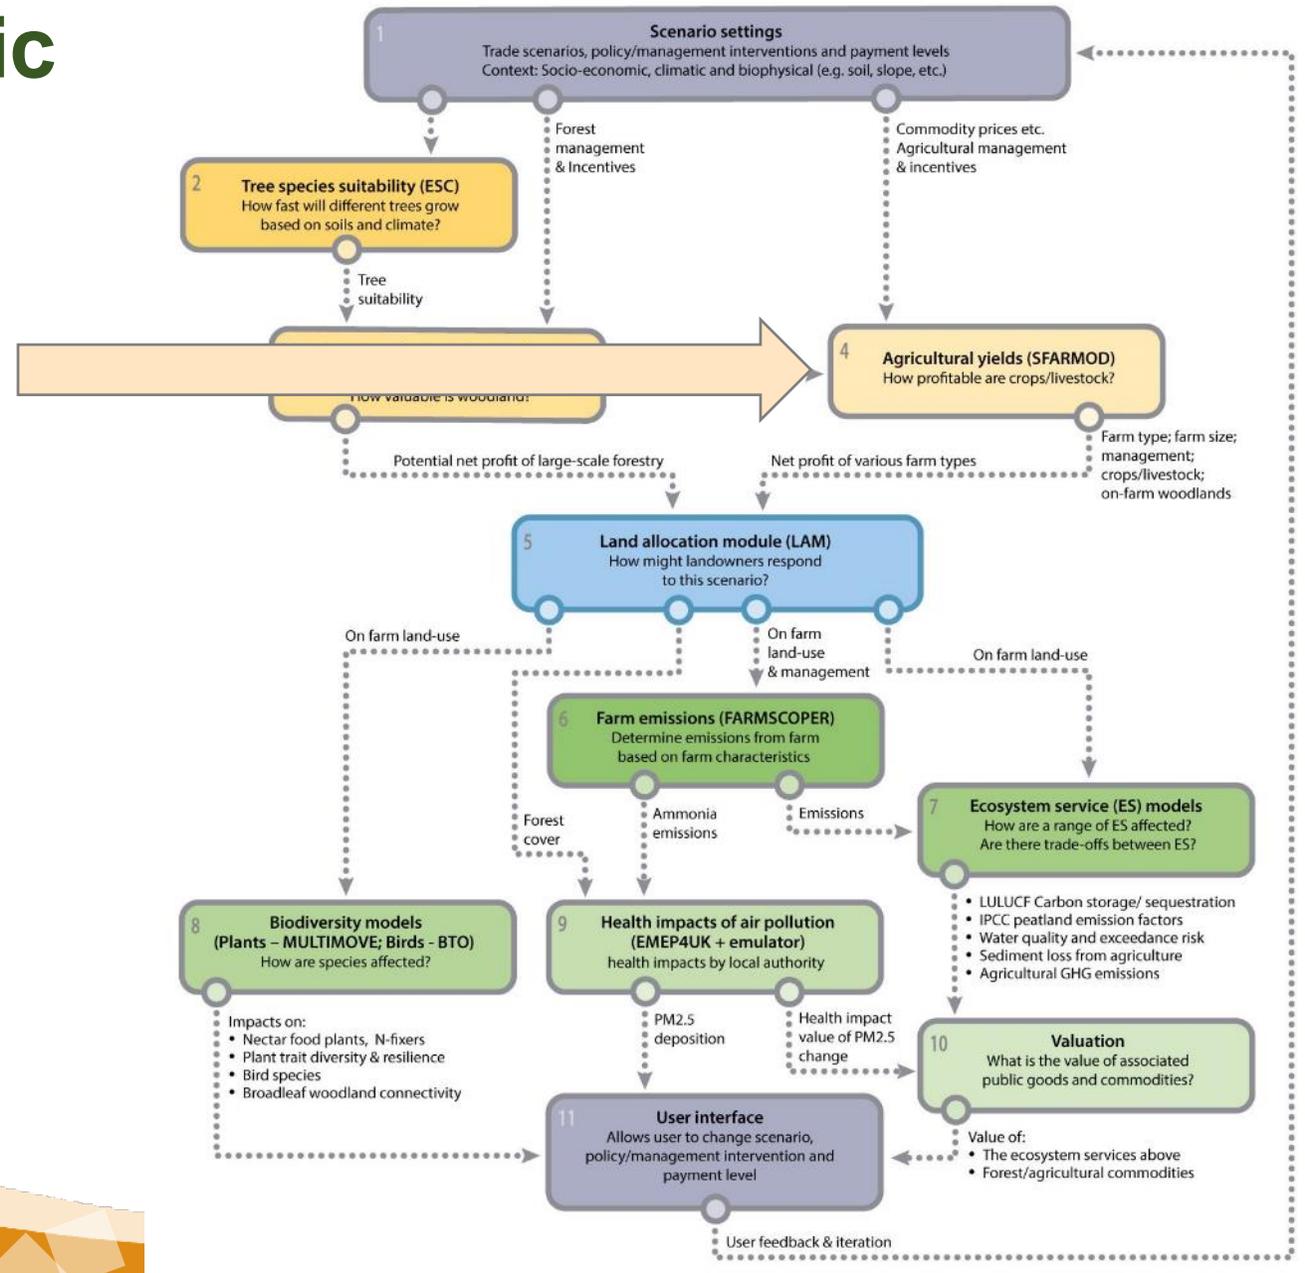

- Simulates consequences of land use and land management change on biodiversity and ecosystem services

# IMP schematic

## Farm-scale model:

- Decisions based on profitability (considering climate, soils, management and incentives)

Scenario settings co-created with Welsh Government

## Top of modelling chain:

- Simulates land use and land management change

## Bottom of modelling chain:

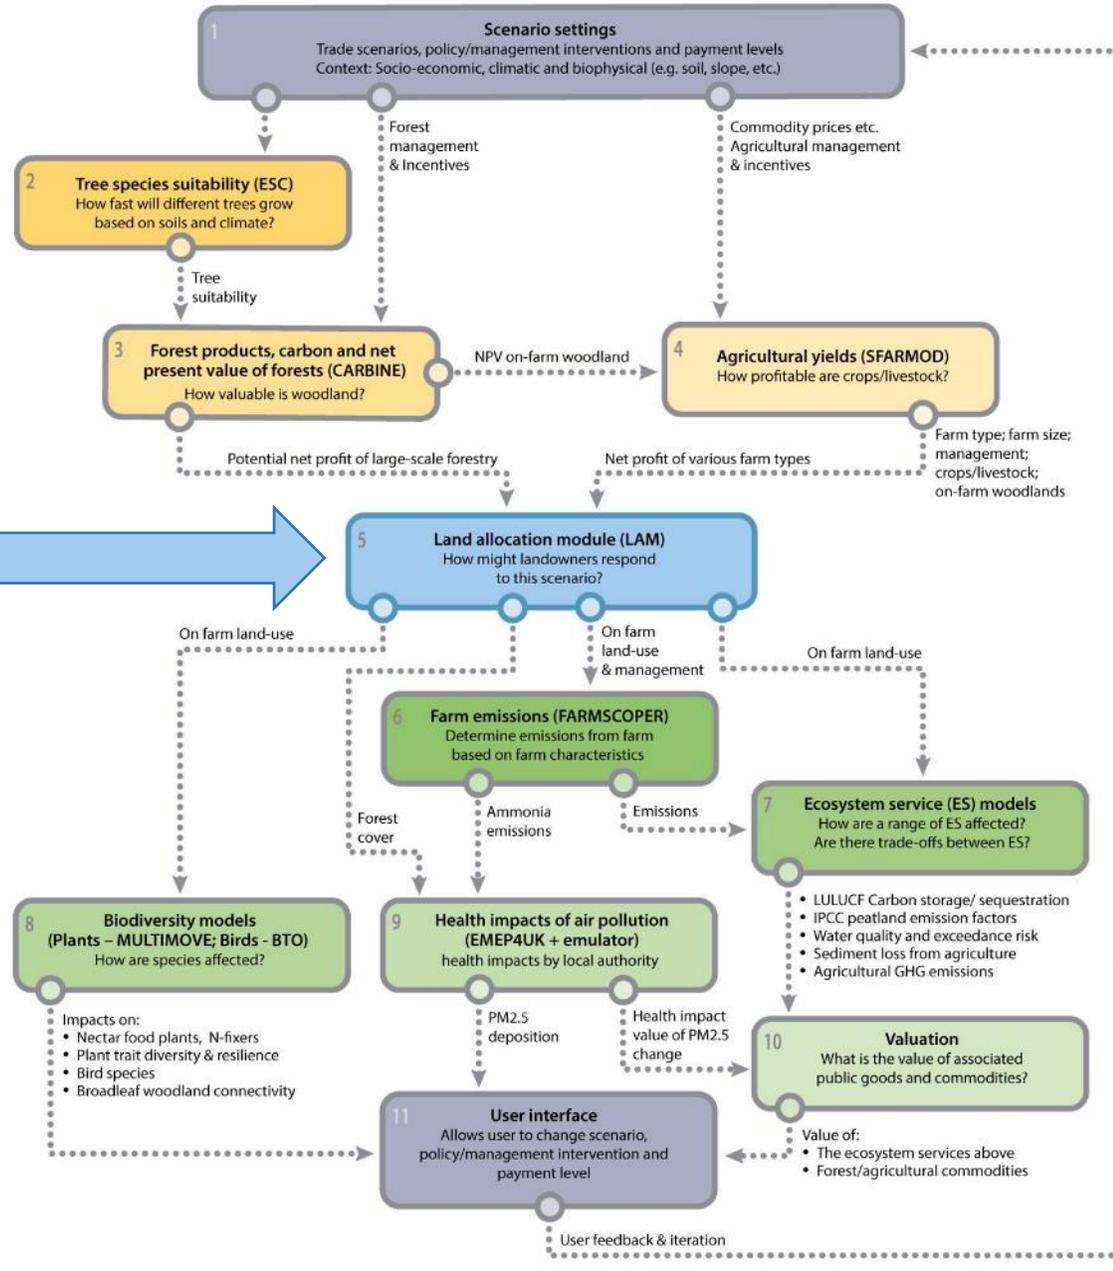

- Simulates consequences of land use and land management change on biodiversity and ecosystem services

# IMP schematic

## Land Allocation Model:

- Developed specifically with WG to respond to changes in on-farm income

Scenario settings co-created with Welsh Government

## Top of modelling chain:

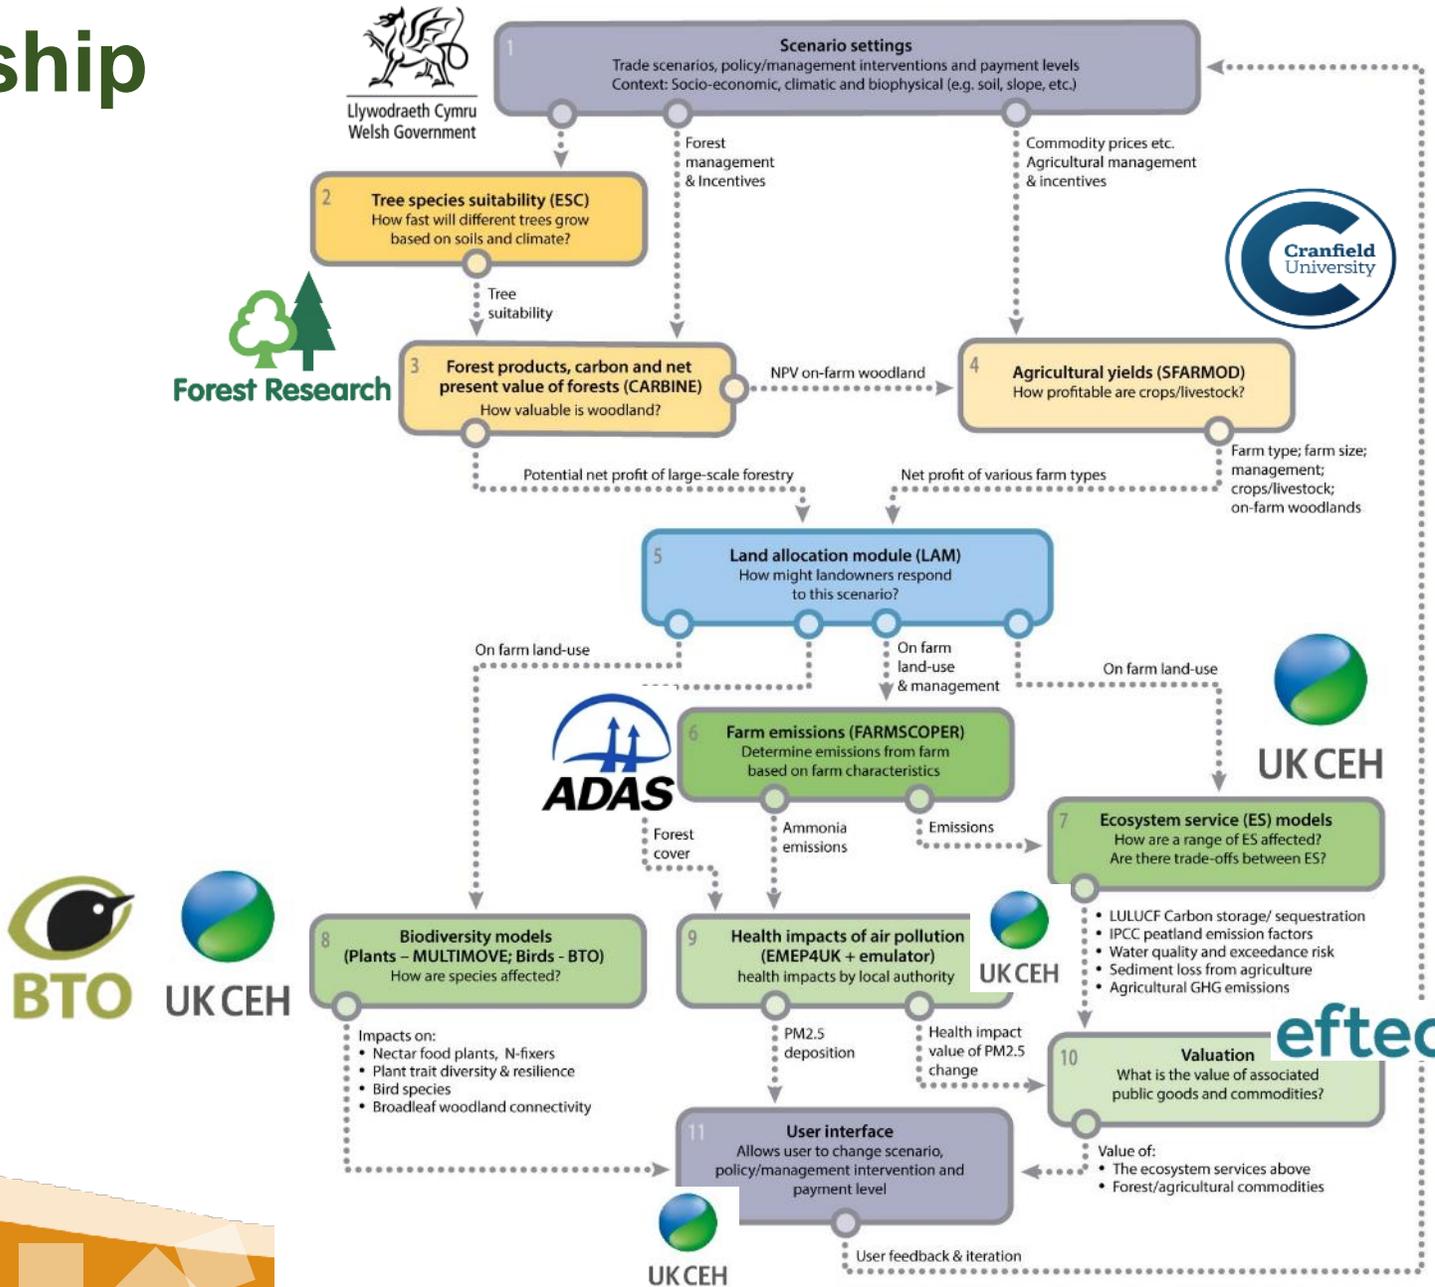

- Simulates land use and land management change

## Bottom of modelling chain:

- Simulates consequences of land use and land management change on biodiversity and ecosystem services

# A partnership approach

# Aqua Book Compliance

## RIGOUR:

- **Repeatable:** Same inputs/ constraints → same outputs.
- **Independent:** Free of prejudice or bias.
- **Grounded in reality:** Connections made between the analysis and its real-world consequences.
- **Objective:** Effective engagement and suitable challenge reduces potential bias.
- **Uncertainty-managed:** Uncertainties identified, managed and communicated.
- **Robust:** Result provided in the context of residual uncertainty and limitations in order to ensure it is used appropriately.

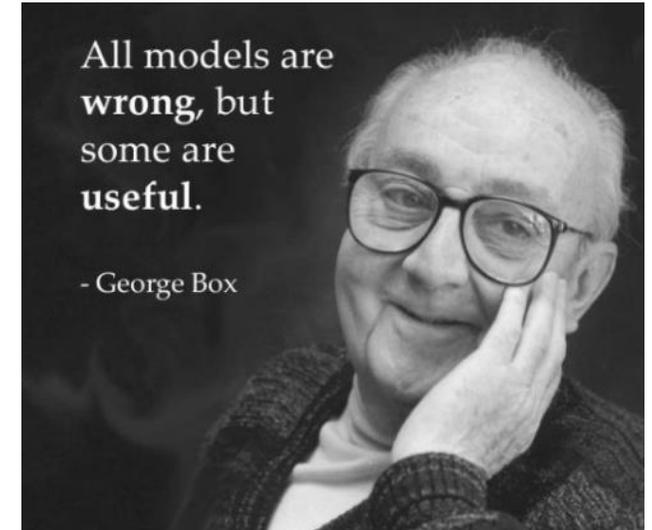

- **Assumptions detailed and agreed**
- **QA performed and documented**
- **Uncertainties explored**

# IMP limitations and assumptions (examples)

Models are a simplification of reality, but they can provide useful insight when used for a particular purpose ... all models have limitations and make simplifying assumptions, e.g.

- The IMP is applied to only 'full-time farms' (> 1 FTE labour).
- Changes in land use are driven by on-farm economics and land suitability. They do not take into account skills or cultural and behaviour responses.
- As a simplification, the biodiversity and ecosystem service models in the IMP assume that a farm that comes under economic pressure will leave agriculture in the short-term, with the land undergoing natural regeneration or being afforested.

# ERAMMP IMP outputs

- Outputs are **both graphical and spatial** and have been provided to WG as **annotated slide packs**.
- Slide notes contain an assessment of how the results can be interpreted including any **uncertainties, limits to knowledge** and implications of **assumptions** made within the modelling.

# Iterative exploration of SFS bundles

- The IMP is being adapted to model some potential components of the SFS starting with:
  - Habitat management bundle
  - Woodland and hedgerow creation bundle
  - Land/nutrient management bundle
- Highly exploratory and iterative process -> learning from 1<sup>st</sup> phase will inform additional runs
- Inputs: range of payment levels associated with changes in management practices
- Outputs:
  - Cost and uptake of the scheme components for different payment levels
  - Environmental and economic outcomes for full-time farms, biodiversity and public goods, including public good values for carbon, water quality and air quality.

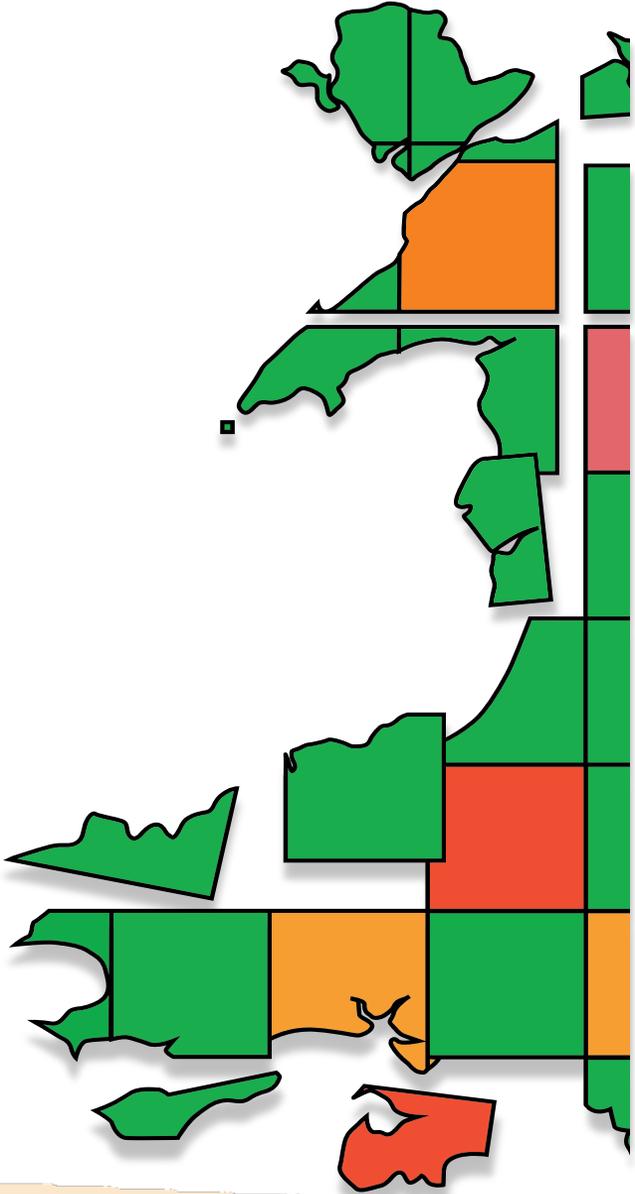

# ERAMMP IMP: Summary

- The IMP provides a new **policy-relevant, integrated modelling tool** that can provide scientific evidence to inform rapidly evolving policies across sectors.
- Particularly important to its development and its application to the SFS are:
  - **Co-design** through a long-term partnership between WG and the IMP team;
  - **Transparency** of the model and its assumptions (following Aqua book);
  - **Iterative approach**: builds trust and understanding in the results;
  - **Flexible**: can be adapted quickly to changing WG needs;
  - **Timely**: model runs delivered at a pace that is able to inform quickly evolving policy needs.
- The IMP is able to rapidly explore costs, benefits and impacts of scheme components, but this work is still in progress and will continue to be iterated with WG.

**Diolch yn fawr iawn**
